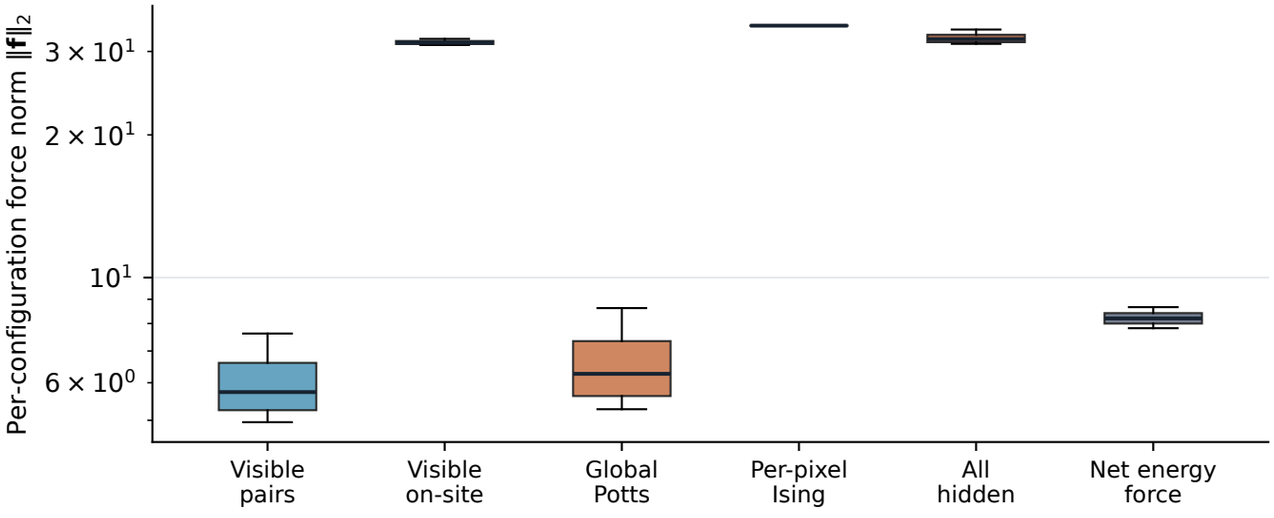
Force contributions at the end of generation

Potts 1,536 | s = 5, t = 0 | 2,000 saved generated configurations

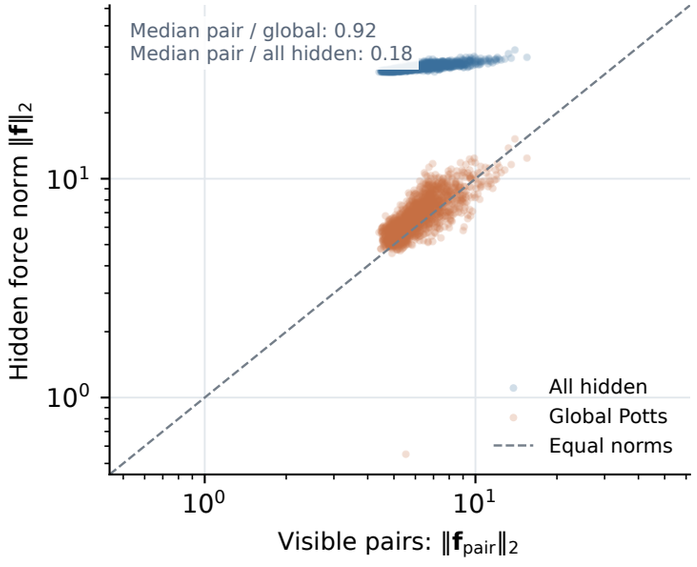
Final-time measurements only; these panels do not show forces along trajectories.

a Forces across saved configurations



Boxes: 25–75%; whiskers: 10–90%. Norms are computed before averaging over images.

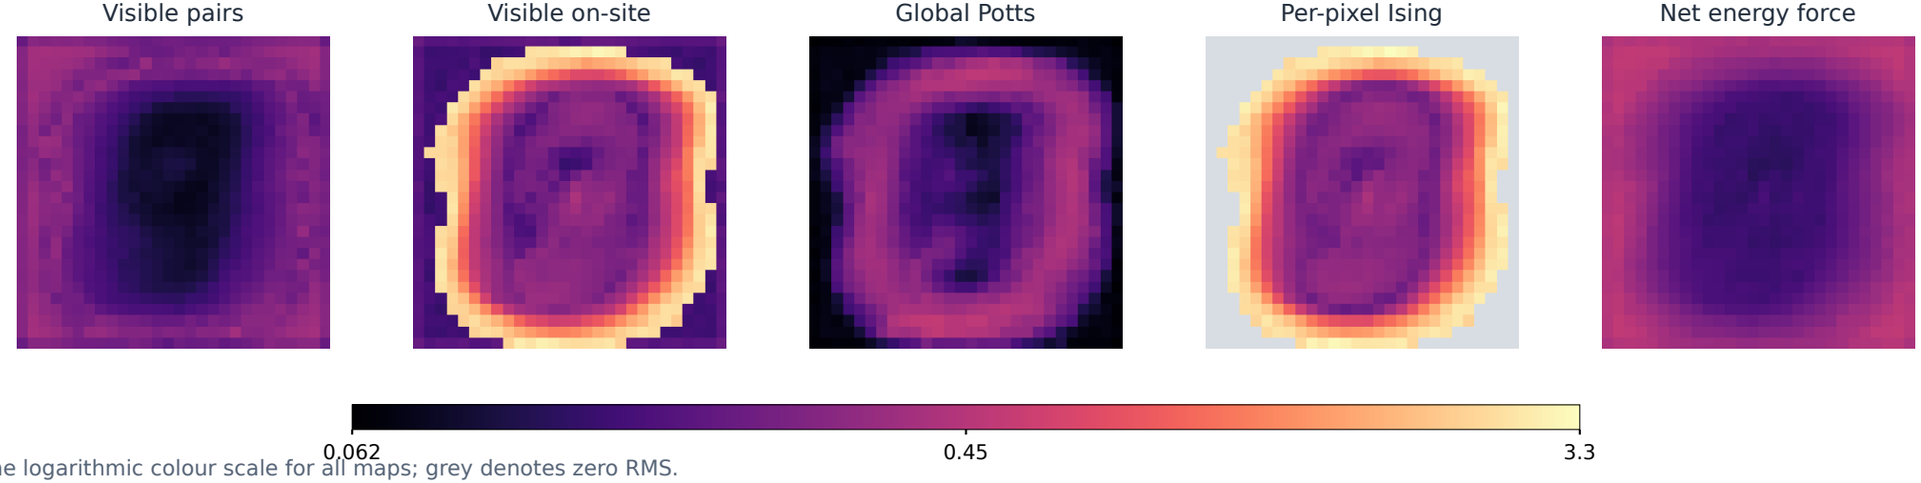
b Paired comparison



Visible = pairs + on-site; hidden = global + per-pixel. Components are added as vectors.

Visible–hidden alignment: median cos θ = -0.968. Median net / (visible norm + hidden norm) = 0.126.

c Per-pixel RMS force across configurations



One logarithmic colour scale for all maps; grey denotes zero RMS.

Energy forces f = −∇F in normalized coordinates. Reverse-SDE drift = x + 2f; Brownian forcing is not included.
