Visible springs across the full lattice

All ten MNIST digits | Potts 1,536 | 2,970 distinct visible edges

Each heat-map pixel is one edge, located at its first endpoint; grey indicates no edge.

One linear colour scale for every map; early-time coefficients are small on this scale.

Peak spring magnitude

Full lattice: $s = 5.00$

RMS = 0.317

Central patch: $s = 3.43$

RMS = 0.0443

c_{ij} multiplies $(x_i - x_j)^2$. All maps and curves use saved coefficients, not sampled trajectories.
